S2 MCA

LAB CYCLE 3

PROGRAM: 10

AIM : Area of different shapes using overloaded functions

ALGORITHM :

Step 1: Start

Step 2: Define the main class

Step 3: Define methods with the same methodname that performs the area operation for each shape

Step 4: Display the areas of each shapes.

Step 5: Stop

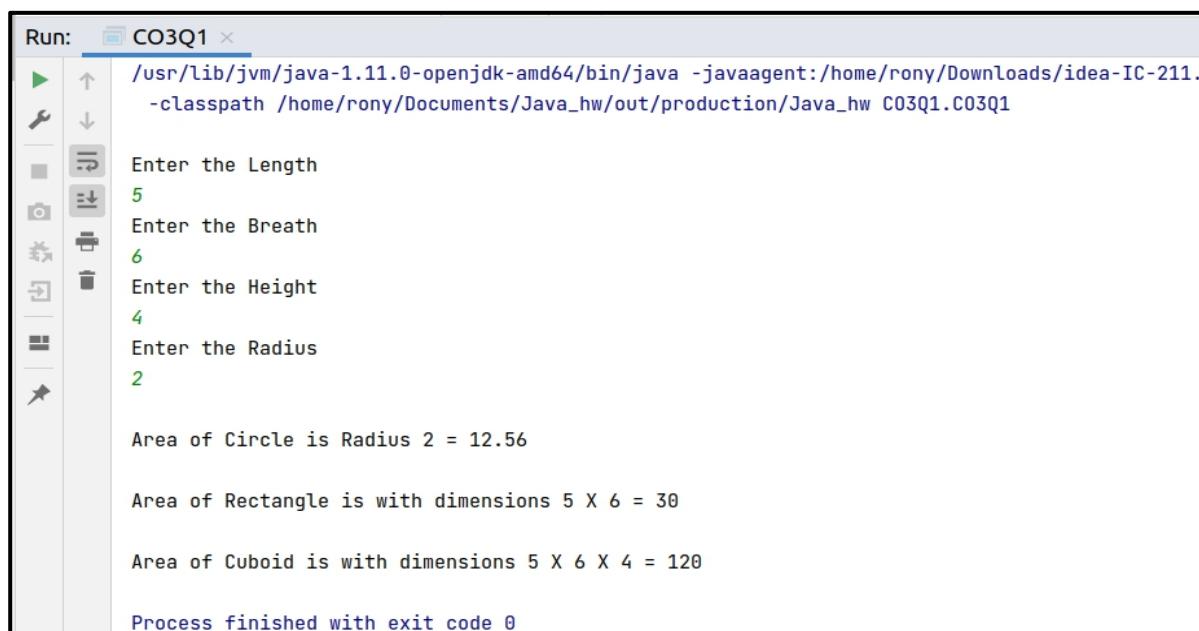

PROGRAM CODE :

CO3Q1.java	package CO3Q1; import java.util.Scanner; public class CO3Q1 { void area(int r1){ double Area_val = 3.14*r1*r1; System.out.println("\nArea of Circle is Radius "+r1+" = "+Area_val); } void area(int a1,int b1){ int Area_val = a1*b1; System.out.println("\nArea of Rectangle is with dimensions "+a1+" X "+b1+" = "+Area_val); } void area(int a1,int b1,int c1){ int Area_val = a1*b1*c1; System.out.println("\nArea of Cuboid is with dimensions "+a1+" X "+b1+" X "+c1+" = "+Area_val); } public static void main(String[] args) { Scanner sc = new Scanner(System.in); System.out.println("\nEnter the Length"); int l = sc.nextInt(); System.out.println("Enter the Breath"); int b = sc.nextInt(); System.out.println("Enter the Height"); int h = sc.nextInt(); System.out.println("Enter the Radius"); int r = sc.nextInt(); } }
------------	---

```
CO3Q1 obj1 = new CO3Q1();
obj1.area(r);
obj1.area(l,b);
obj1.area(l,b,h);
}
}
```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

The screenshot shows a Java IDE's run window titled "CO3Q1". The terminal output shows the execution of the program:

```
Run: CO3Q1 ×
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO3Q1.CO3Q1

Enter the Length
5
Enter the Breath
6
Enter the Height
4
Enter the Radius
2

Area of Circle is Radius 2 = 12.56

Area of Rectangle is with dimensions 5 X 6 = 30

Area of Cuboid is with dimensions 5 X 6 X 4 = 120

Process finished with exit code 0
```

PROGRAM: 11

AIM : Create a class ‘Employee’ with data members Empid, Name, Salary, Address and constructors to initialize the data members. Create another class ‘Teacher’ that inherit the properties of class employee and contain its own data members department, Subjects taught and constructors to initialize these data members and also include display function to display all the data members. Use array of objects to display details of N teachers.

ALGORITHM :

Step 1: Start

Step 2: create class “employee” with the provided data members and define the constructors

Step 3: create another class “Teachers” that performs inheritance of employee class and define constructors for the same

Step 4: create an array of objects in the corresponding class

Step 5: Display the details for the number of teachers provided

Step 6: Stop

PROGRAM CODE :

Teacher.java	package CO3Q2; import java.util.Scanner; class Employee { int Empid; String Name; double Salary; String Address; Employee(int no, String na, double sal, String add) { this.Empid = no; this.Name = na; this.Salary = sal; this.Address = add; } } public class Teacher extends Employee{ String dept; String subject; Teacher(int no, String na, double sal, String add, String dep, String sub){
--------------	---

```

        super(no,na,sal,add);
        this.dept= dep;
        this.subject=sub;
    }

    void display(){
        System.out.println("Employee id: "+Empid);
        System.out.println("Name: "+Name);
        System.out.println("Salary: "+Salary);
        System.out.println("Address: "+Address);
        System.out.println("Department: "+dept);
        System.out.println("Subject: "+subject);
    }

    public static void main(String[] args) {
        System.out.println("\nEnter the No. of Employee's");
        Scanner sc1 = new Scanner(System.in);
        int num = sc1.nextInt();
        Teacher arr[]=new Teacher[num];
        for(int i =0;i<num;i++)
        {
            Scanner sc =new Scanner(System.in);
            System.out.println("Enter Employee id: ");
            int Empid=sc.nextInt();
            System.out.println("Enter Employee Name: ");
            String Name=sc.next();
            System.out.println("Enter Salary: ");
            double Salary=sc.nextDouble();
            System.out.println("Enter Address: ");
            String Address=sc.next();
            System.out.println("Enter department: ");
            String dept=sc.next();
            System.out.println("Enter Subject: ");
            String subject=sc.next();
            arr[i]=new Teacher(Empid,Name,Salary,Address,dept,subject);
            sc.close();
        }
        System.out.println("\n*****Informations of all the
employee's*****");
        for(int i=0;i<num;i++){
            int j=i+1;
            System.out.println("\n"+j+"." );
            arr[i].display();
        }
        sc1.close();
    }
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```
Run: Teacher x
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar=37705:/home/rony/Downloads/idea-IC-211.7442.40/bin -Dfile.encoding=UTF-8
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw C03Q2.Teacher

PROGRAM: 13

AIM : Write a program has class Publisher, Book, Literature and Fiction. Read the information and print the details of books from either the category, using inheritance.

ALGORITHM :

Step 1: Start

Step 2: create class “publisher” and initialize its data members

Step 3: create classes book, literature, fiction. Each class inherit from their subsequent previous class and have its own data members

Step 4: create an array of objects in the corresponding class

Step 5: Display the details of the books require

Step 6: Stop

PROGRAM CODE :

bookDetails.java	package CO3Q4; import java.util.Scanner; class Publisher{ String publisher; Publisher(String pub){ this.publisher=pub; } class Book extends Publisher{ String book; Book(String pub,String boo){ super(pub); book=boo; } class Literature extends Book{ String category; Literature(String pub, String boo){ super(pub, boo); } void display(){ System.out.println("Publisher :" +publisher); System.out.println("Book :" +book); } class Fiction extends Book{ Fiction(String pub, String boo){ super(pub, boo); } } } } }
------------------	--

```

    }
    void display(){
        System.out.println("Publisher :" +publisher);
        System.out.println("Book :" +book);
    }
}
public class bookDetails{
    public static void main(String[] args) {
        System.out.println("Enter the No. of Literature Books");
        Scanner sc1 = new Scanner(System.in);
        int num = sc1.nextInt();

PROGRAM: 15

AIM : Create an interface having prototypes of functions area() and perimeter(). Create two classes Circle and Rectangle which implements the above interface. Create a menu driven program to find area and perimeter of objects.

ALGORITHM :

Step 1: Start

Step 2: Create an interface Calculation that has the methods to take inputs and compute area and perimeter

Step 3: Create classes Circle and Rectangle that implements calculation

Step 4: Display the area and perimeter of circle or rectangle depending upon the choice the user selects.

Step 5: Stop

PROGRAM CODE :

CO3Q6.java	package CO3Q6;// Create an interface having prototypes of functions area() and perimeter(). Create two // classes Circle and Rectangle which implements the above interface. Create a menu driven // program to find area and perimeter of objects. import java.util.Scanner; interface prop { void getdata(); void area(); void perimeter(); } class Circle implements prop { double pi = 3.14; double r; Scanner sc = new Scanner(System.in); @Override public void getdata() { System.out.println("Enter the radius of the circle:"); r = sc.nextDouble(); } @Override public void perimeter(){ System.out.println("Perimeter of the circle: "+(2*pi*r)); } }
------------	---

```

    }
    @Override
    public void area()
    {
        System.out.println("Perimeter of the circle: "+(pi*r*r));
    }
}
class Rectangle implements prop
{
    double l,b;
    Scanner sc = new Scanner(System.in);
    @Override
    public void getdata(){
        System.out.println("Enter the length of the rectangle:");
        l = sc.nextDouble();
        System.out.println("Enter the breadth of the rectangle:");
        b = sc.nextDouble();
    }
    @Override
    public void area()
    {
        System.out.println("Perimeter of a rectangle: "+(l*b));
    }
    @Override
    public void perimeter()
    {
        System.out.println("Perimeter of a rectangle: "+(2*(l+b)));
    }
}
public class CO3Q6
{
    public static void main(String[] args)
    {
        int ch;
        Scanner sc = new Scanner(System.in);
        Circle ob = new Circle();
        Rectangle obj = new Rectangle();
        do
        {
            System.out.println("\n1.Circle\n2.Rectangle\n3.exit");
            System.out.println("Enter your choice:");
            ch = sc.nextInt();
            switch(ch)
            {
                case 1 :ob.getdata();
                    ob.area();
                    ob.perimeter();
                    break;
                case 2 :obj.getdata();
                    obj.area();
                    obj.perimeter();
                    break;
            }
        }
    }
}

```

```
        case 3 :System.out.println("Exited...");
                    System.exit(0);
                }
            }while(true);
        }
    }
```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

The screenshot shows a Java IDE interface with a 'Run' configuration window titled 'CO3_Q6'. The configuration details are:

```
Run: CO3_Q6
  /usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/I
  -classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO3Q6.
```

The main output window displays the execution of the program, which prompts the user for a choice between 1.Circle, 2.Rectangle, and 3.exit. The user selects 1.Circle, enters a radius of 4, and receives two outputs for the perimeter of a circle with radius 4 (12.56). The user then selects 2.Rectangle, enters a length of 5 and a breadth of 3, and receives two outputs for the perimeter of a rectangle (12.0 and 14.0). Finally, the user selects 3.exit, and the program exits with the message 'Exited...'.

```
1.Circle
2.Rectangle
3.exit
Enter your choice:
1
Enter the radius of the circle:
2
Perimeter of the circle: 12.56
Perimeter of the circle: 12.56

1.Circle
2.Rectangle
3.exit
Enter your choice:
2
Enter the length of the rectangle:
3
Enter the breadth of the rectangle:
4
Perimeter of a rectangle: 12.0
Perimeter of a rectangle: 14.0

1.Circle
2.Rectangle
3.exit
Enter your choice:
3
Exited...
```

PROGRAM: 16

ALGORITHM :

Step 1: Start

Step 2: Create interface calc that performs the calculation operations.

Step 3: Create class bill that implements the interface calc

Step 4: Display the net amount by acquiring the data for the specific inputs

Step 5: Stop

PROGRAM CODE :

CO3Q7.java

```
package CO3Q7;  
  
import java.util.Scanner;  
  
interface calc  
{  
    void calculate();  
}  
  
class bill implements calc  
{  
    String date,name,p_id;  
    int quantity;  
    double unit_price,total,namount=0;  
    Scanner sc = new Scanner(System.in);  
    public void getdata()  
    {  
        System.out.println("Enter product id:");  
        p_id = sc.nextLine();  
    }  
}
```

```

        System.out.println("Enter product name:");
        name = sc.nextLine();
        System.out.println("Enter the Quantity:");
        quantity = sc.nextInt();
        System.out.println("Enter the unit price:");
        unit_price = sc.nextDouble();
    }

    @Override
    public void calculate()
    {
        total = quantity * unit_price;
    }
    public void display()
    {

System.out.println(p_id+"\t\t"+name+"\t\t"+quantity+"\t\t"+unit_price+"\t\t"+total);
    }
}

public class CO3Q7
{
    public static void main(String[] args)
    {
        int n,i;
        double namount=0,t;
        int ran;
        String date;
        t = Math.random() *1000000;
        ran = (int) t;
        Scanner sc = new Scanner(System.in);
        System.out.println("Order no. #"+ran);
        System.out.println("Enter the date:");
        date = sc.nextLine();
        System.out.println("Enter how many products are there:");
        n = sc.nextInt();
        bill ob[] = new bill[n];
        for(i=0;i<n;i++)
            ob[i] = new bill();
        for(i=0;i<n;i++){
            ob[i].getdata();
            ob[i].calculate();
        }
        System.out.println("Date:"+date);
        System.out.println("Product Id \tName\t Quantity\t unit price\t Total ");
        System.out.println("-----");
        for(i=0;i<n;i++){
    }
}

```

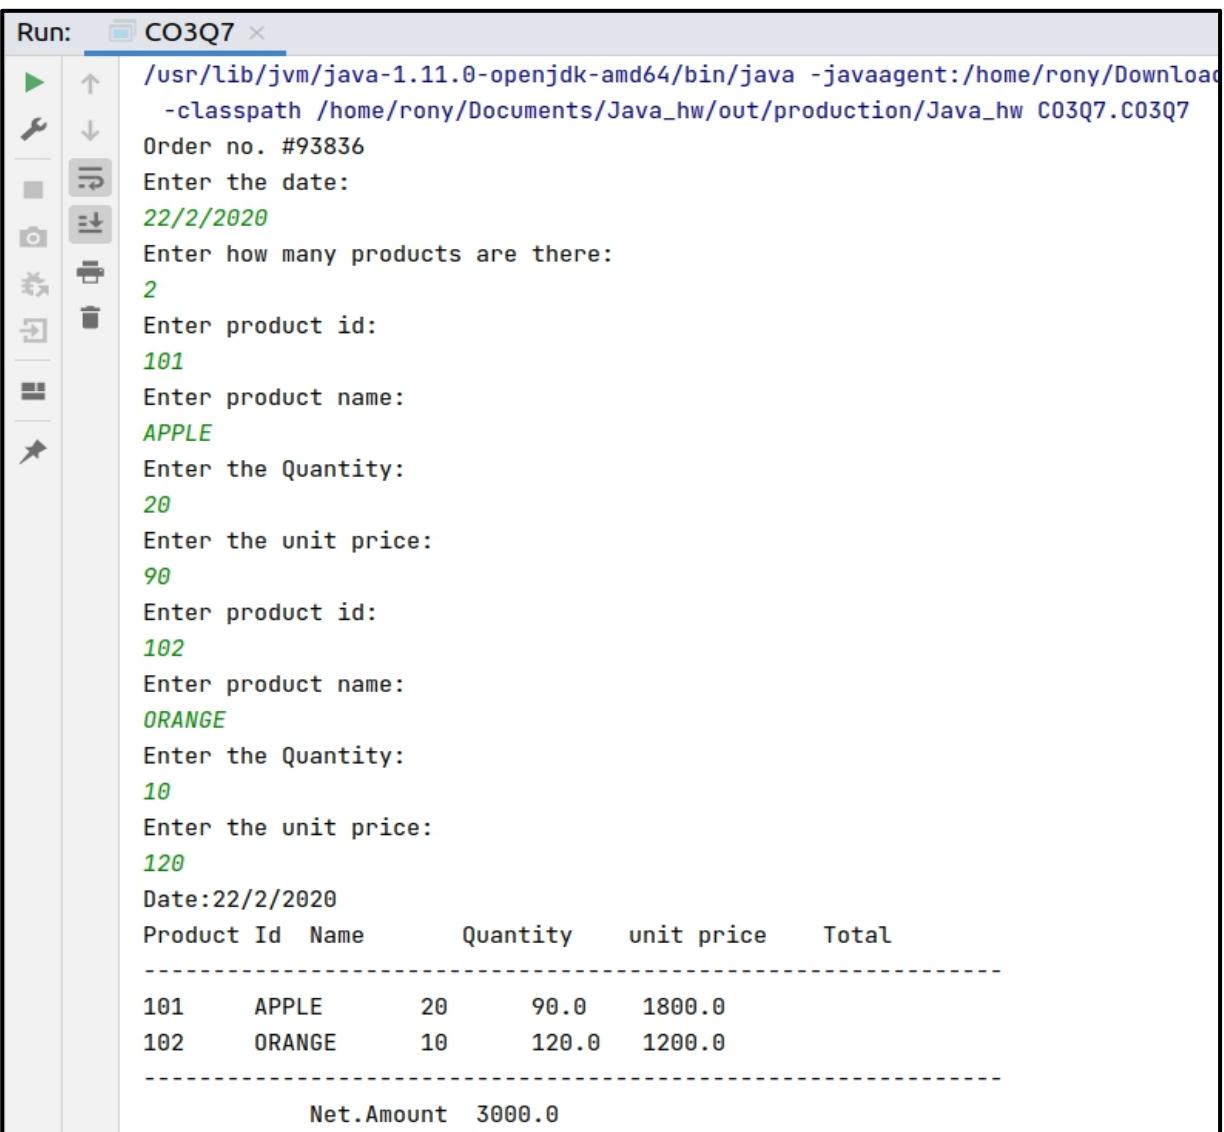

```

        ob[i].display();
        namount += ob[i].total;
    }
    System.out.println("-----");
    System.out.println("\t\t\tNet.Amount\t"+ namount);
}
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

The screenshot shows a Java IDE's run configuration window titled "Run: CO3Q7". The configuration details are as follows:

- Path: /usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/ -classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO3Q7.CO3Q7
- Order no.: #93836
- Enter the date: 22/2/2020
- Enter how many products are there: 2
- Enter product id: 101
- Enter product name: APPLE
- Enter the Quantity: 20
- Enter the unit price: 90
- Enter product id: 102
- Enter product name: ORANGE
- Enter the Quantity: 10
- Enter the unit price: 120
- Date: 22/2/2020

The output window displays the following table and summary:

Product Id	Name	Quantity	unit price	Total
101	APPLE	20	90.0	1800.0
102	ORANGE	10	120.0	1200.0
				Net.Amount 3000.0

LAB CYCLE 4

PROGRAM: 17

AIM : Create a Graphics package that has classes and interfaces for figures Rectangle, Triangle, Square and Circle. Test the package by finding the area of these figures..

ALGORITHM :

Step 1: Start

Step 2: To create a package named graphics, create a folder of the same name in the directory. Here inside that we have another module named calculate

Step 3: Inside the graphics folder, create modules for finding the areas of rectangle, circle, triangle and square.

Step 4: Outside the graphics folder, write a program to access the modules mention above and print the output

Step 5: Stop

PROGRAM CODE :

driver.java	//Create a Graphics package that has classes and interfaces for figures Rectangle, Triangle, //Square and Circle. Test the package by finding the area of these figures. package CO4Q1; import CO4Q1.graphics.circle; import CO4Q1.graphics.rectangle; import CO4Q1.graphics.square; import CO4Q1.graphics.triangle; import java.util.Scanner; public class driver { public static void main(String[] args) { Scanner sc = new Scanner(System.in); int choice; circle obj1 = new circle(); rectangle obj2 = new rectangle(); square obj3 = new square(); triangle obj4 = new triangle(); System.out.println("Choose any 1)Circle 2)Rectangle 3)Square 4)Triangle: "); choice = sc.nextInt(); switch (choice) { case 1: System.out.println("Area of Circle is " + obj1.area()); break; case 2: System.out.println("Area of Rectangle is " + obj2.area()); break; case 3: System.out.println("Area of Square is " + obj3.area()); break; case 4: System.out.println("Area of Triangle is " + obj4.area()); break; default: System.out.println("Wrong Choice"); } } }
-------------	--

	<pre> case 1: obj1.area(); break; case 2: obj2.area(); break; case 3: obj3.area(); break; case 4: obj4.area(); default: break;}} } </pre>
circle.java	<pre> package CO4Q1.graphics; import java.util.Scanner; public class circle implements area_cal{ int radius; @Override public void area() { Scanner sc = new Scanner(System.in); System.out.println("Input radius of circle : "); radius = sc.nextInt(); String area = Double.toString(Math.PI*radius*radius); System.out.println("Area of the circle is : "+area); sc.close(); } } </pre>

Process finished with exit code 0
```

PROGRAM: 19

AIM : . Write a user defined exception class to authenticate the user name and password.

ALGORITHM :

Step 1: Start

Step 2: Create a class named usernameex that inherits Exception class with a constructor that calls Exception class constructor and pass error meaasage.

Step 3: Create a class named passwordex that inherits Exception class with a constructor that calls Exception class constructor and pass error meaasage.

Step 4: Inside the main(), Read the username and password.

Step 5: Inside the try block, we throw usernamex and passwordex with appropriate message if any of the conditon is true:

- a. If username is empty
- b. If password is empty
- c. If password doesnt contain special charecters
- d. If username length is less than 6
- e. If password is not string enough

Step 6: Inside the catch block with parameter usernameex's object, print “USERNAME EXCEPTION OCCURED”

Step 7: Inside the catch block with parameter passwordex's object, print “PASSWORD EXCEPTION OCCURED”

Step 8:Stop

PROGRAM CODE :

authentication.java	package CO4Q3; import java.util.Scanner; public class authentication { public static void main(String[] args) { String username = "Himmler"; String password = "U-boat"; Scanner sc = new Scanner(System.in); System.out.println("Enter the Username"); String u1 = sc.nextLine(); System.out.println("Enter the Password"); String u2 = sc.nextLine(); try { } } }
---------------------	---

	<pre> if ((u1.equals(username)) && (u2.equals(password))) { System.out.println("Access Granted"); } else { throw new CredentialException("Invalid Credentials"); } catch (CredentialException e){ System.out.println(e.getMessage()); } </pre>
credentialexception.java	<pre> package CO4Q3; public class CredentialException extends Exception{ public CredentialException(String s){ super(s); } } </pre>

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

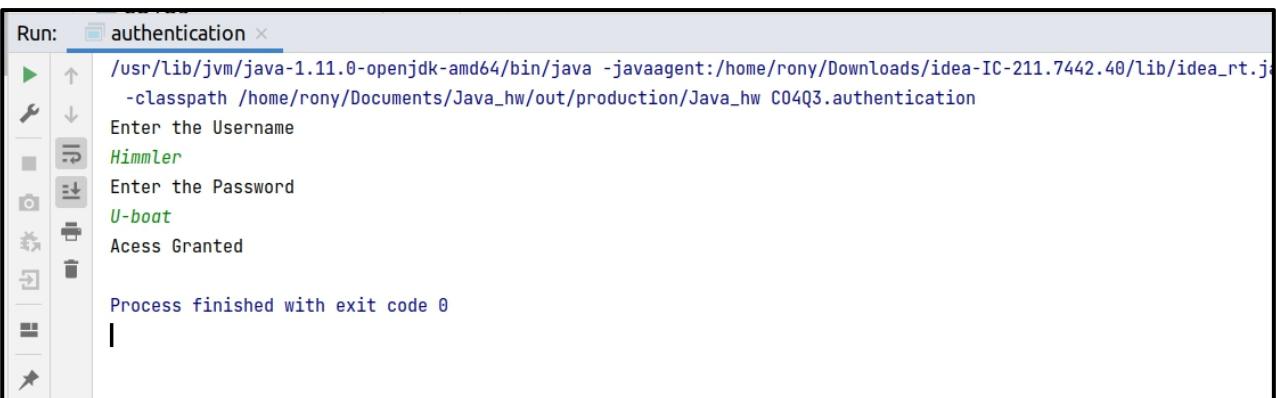

The screenshot shows the IntelliJ IDEA run terminal window titled "authentication". The terminal output is as follows:

```

Run: authentication ×
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO4Q3.authentication
Enter the Username
roni
Enter the Password
Qwerty
Invalid Credentials

Process finished with exit code 0
|
```

The screenshot shows the IntelliJ IDEA run terminal window titled "authentication". The terminal output is as follows:

```

Run: authentication ×
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO4Q3.authentication
Enter the Username
Himmler
Enter the Password
U-boot
Access Granted

Process finished with exit code 0
|
```

PROGRAM: 20

AIM : . Find the average of N positive integers, raising a user defined exception for each negative input.

ALGORITHM :

Step 1: Start

Step 2: Create a class named NegException that inherits Exception class with a constructor inside which we call the Exception class constructor and pass error message.

Step 3: Inside the main(), Read the limit of array

Step 4: Inside the try block, read the array and check if any element is less than 0

Step 5: If true, throw NegException with appropriate message.

Step 6: Calculate the average of the array and print it

Step 7: Inside the catch exception, Print “NEGATIVE EXCEPTION OCCURED”

Step 8: Stop

PROGRAM CODE :

average1.java

```
package CO4Q4;
import java.util.Scanner;
public class average {
    public static void main(String[] args) {
        double sum = 0;
        Scanner sc = new Scanner(System.in);
        System.out.println("Count of numbers");
        int N = sc.nextInt();
        int[] numbers = new int[N];
        for(int i=0;i<N; i++){
            System.out.println("Enter the number");
            numbers[i] = sc.nextInt();
        }
        for(int i=0;i<N; i++){
            try{
                if(numbers[i] >= 0) {
                    sum += numbers[i];
                } else {
                    throw new negative_exception("Negative number : "
+numbers[i]);
                }
            }
        }
    }
}
```

	<pre> catch (negative_exception e){ System.out.println(e.getMessage()); } } double avg = sum/N; System.out.println("Average of Positive Numbers =" +avg); } } </pre>
negative_exception.java	<pre> package CO4Q4; public class negative_exception extends Exception{ public negative_exception(String s){ super(s); } } </pre>

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

The screenshot shows the Java IDE's run configuration window. The title bar says "Run: average". The command line shows the Java command being run: "/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar=40159,-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO4Q4.average". The output pane displays the following text:

```

Count of numbers
4
Enter the number
1
Enter the number
-1
Enter the number
2
Enter the number
-2
Negative number : -1
Negative number : -2
Average of Positive Numbers =0.75

Process finished with exit code 0

```

PROGRAM: 21

AIM : . Define 2 classes; one for generating multiplication table of 5 and other for displaying first N prime numbers. Implement using threads. (Thread class)

ALGORITHM :

Step 1: Start

Step 2: Create a class named mul that inherits Thread class with member function as run()

Step 3: Inside run(), Print the multiplication table for 5

Step 4: Create a class named prime that inherits Thread class with member function run()

Step 5: Inside run(), Print the prime numbers upto the limit of user's choice

Step 6: In main(), create an object for the classes and call start() using each object

Step 7: Stop

PROGRAM CODE :

driver.java	package CO4Q5; import java.util.Scanner; public class driver { public static void main(String[] args) { System.out.println("Enter The number"); Scanner sc = new Scanner(System.in); int number = sc.nextInt(); mul obj1 = new mul(); obj1.start(); prime obj2 = new prime(number); obj2.start(); } }
mul.java	package CO4Q5; public class mul extends Thread{ public void run(){ System.out.println("\n"); for(int i =0;i<11;i++){ System.out.println("5*" + i + " = " + 5*i); } } }

```

prime.java package CO4Q5;

public class prime extends Thread{
    int num;
    public prime(int n){
        this.num=n;
    }
    public void run(){
        int x, y, flg;
        System.out.println("All the Prime numbers within 1 and " + num + " are:");
        for (x = 1; x <= num; x++) {
            if (x == 1 || x == 0)
                continue;
            flg = 1;
            for (y = 2; y <= x / 2; ++y) {
                if (x % y == 0) {
                    flg = 0;
                    break;
                }
            }
            if (flg == 1)
                System.out.print("\n prime number =" + x + " ");
        }
    }
}

```

RESULT : The above program is successfully executed and obtained the output

OUTPUT :

```

Run: driver (2) ×
/usr/lib/jvm/java-1.11.0-openjdk-amd64/bin/java -javaagent:/home/rony/Downloads/idea-IC-211.7442.40/lib/idea_rt.jar
-classpath /home/rony/Documents/Java_hw/out/production/Java_hw CO4Q5.driver
Enter The number
10

All the Prime numbers within 1 and 10 are:

prime number =2
prime number =3
prime number =5
prime number =7 5*0 = 0
5*1 = 5
5*2 = 10
5*3 = 15
5*4 = 20
5*5 = 25

5*10 = 50

```

PROGRAM: 22

AIM : . Define 2 classes; one for generating Fibonacci numbers and other for displaying even numbers in a given range. Implement using threads. (Runnable Interface)gs.

ALGORITHM :

Step 1: Start

Step 2: Create a class named even that implements Runnable interface with function run()

Step 3: Inside run(), we read the limit for printing even numbers and print it using for loop.

Step 4: Create another class fib that implements Runnable interface with function run().

Step 5: Inside run(), Initialise n1 as 0,n2 as 1 and n3 as 0.

Step 6: Check if n<0, if true, print “Enter a positive number” else goto step 7

Step 7: Repeat step8 to 11 until n3>n

Step 8: Print n1

Step 9: n3=n1+n2

Step 10: n1=n2

Step 11: n2=n3

Step 12: Create object e of even and create an object t1 of Thread with its parameterized constructor passing e as parameter

Step 13: Call start() using t1

Step 14: Do the same for class odd with Thread object t2 and call start() using t2

Step 15: Stop

PROGRAM CODE :

driver.java	package CO4Q6; import java.util.Scanner; public class driver { public static void main(String[] args) { Scanner sc = new Scanner(System.in); System.out.println("Enter the lower limit of range"); int x = sc.nextInt(); System.out.println("Enter the Upper limit of range"); int y = sc.nextInt(); Runnable r = new fibannoci(x,y); Thread obj1 = new Thread(r); obj1.start(); } }

Process finished with exit code 0
```

PROGRAM: 23

AIM : . Producer/Consumer using ITC

ALGORITHM :

Step 1: Start

Step 2:In PC class (A class that has both produce and consume methods), a linked list of jobs and a capacity of the list is added to check that producer does not produce if the list is full.

Step 3:In Producer class, the value is initialized as 0.

Step 4:We have an infinite outer loop to insert values in the list. Inside this loop, we have a synchronized block so that only a producer or a consumer thread runs at a time. An inner loop is there before adding the jobs to list that checks if the job list is full, the producer thread gives up the intrinsic lock on PC and goes on the waiting state.

Step 5:If the list is empty, the control passes to below the loop and it adds a value in the list.

Step 6:In the Consumer class, we again have an infinite loop to extract a value from the list. Inside, we also have an inner loop which checks if the list is empty.

Step 7:If it is empty then we make the consumer thread give up the lock on PC and passes the control to producer thread for producing more jobs.

Step 8:If the list is not empty, we go round the loop and removes an item from the list.

Step 9:In both the methods, we use notify at the end of all statements. The reason is simple, once you have something in list, you can have the consumer thread consume it, or if you have consumed something, you can have the producer produce something.

Step 10:sleep() at the end of both methods just make the output of program run in step wise manner and not display everything all at once so that you can see what actually is happening in the program.

Step 11:Stop

PROGRAM CODE :

itc.java	package CO4Q7; //Producer/Consumer using ITC import java.util.ArrayList; import java.util.List; class Producer implements Runnable { List<Integer> flist; int max_size = 5;
----------	--

```
int i=0;

PROGRAM: 24

AIM : Program to create a generic stack and do the Push and Pop operations

ALGORITHM :

Step 1: Start

Step 2: Create a class named stack with data members as a(an array),top(set as -1),ch,item,i; a function named menu()

Step 3: Inside menu(), give choices to push,pop and display the stack

Step 4: If the choice is 1, then check whether the stack is full, else add an element into the stack.

Step 5: If the choice is 2, then check whether the stack is empty, else delete an element into the stack.

Step 6: If the choice is 3, then check whether the stack is empty, else print all the elements in the stack.

Step 7: If the choice is greater than 4, then print “Invalid option”.

Step 8: Inside the main(), create an object of type stack and call the menu() function.

Step 9: Stop

PROGRAM CODE :

driver.java	package CO4Q8; import java.util.*; class operations{ public void operation() { int top =-1,ch,n,e; Scanner inp = new Scanner(System.in); System.out.println("Enter Size of Stack"); n = inp.nextInt(); int size=n-1; int[] arr = new int[n]; do { System.out.println("\n=====\\n MENU : \\n1.push \\n2.pop \\n3.Display \\n4.Exit \\n====="); System.out.println("Enter your choice"); ch = inp.nextInt(); switch(ch) { case 1 : System.out.println("Pushed"); arr[top] = ch; top++; break; case 2 : System.out.println("Popped"); top--; break; case 3 : for(int i=0;i<size;i++) System.out.print(arr[i]); System.out.println(); break; case 4 : System.out.println("Exit"); break; default: System.out.println("Invalid Option"); } } }
-------------	--

```

        if(top == size)

PROGRAM: 25

AIM : . Using generic method perform Bubble sort.

ALGORITHM :

Step 1: Start

Step 2: Create a function named bubblesort(array)

Step 3: n<- length of array

Step 4: Intialize temp<-0

Step 5: i<-0

Step 6:Reapeat steps from to until i>n

Step 7: j<-1,repeat the steps from to until j>n-I

Step 8: check if array[i] >array[j], if true,swap them;else increment j

Step 9: Inside main () Initialize an array with elements and the print the same

Step 10: Call the function bubblesort() and pass the array as parameter

Step 11: Print the sorted array

Step 12: Stop

PROGRAM CODE :

driver.java	package CO2Q1; //. Program to Sort strings import java.util.Scanner; import java.util.Arrays; public class CO2Q1 { public static void main(String[] args) { int i,j; Scanner sc = new Scanner(System.in); System.out.println("Enter the number of words"); int num=sc.nextInt(); String word[]=new String[num]; sc.nextLine();
-------------	---

```

for( i=0;i<num;i++){
    System.out.println("\nEnter a Word\n");
    word[i]=sc.nextLine();
}
for( i=0;i<num-1;i++){
